Rationale

ki is a constructed language, described oligosynthetic, with the primary goal of being the fastest-to-speak language in the world. To try and achieve this I have taken a digital-first approach, ensuring full use of phonological combination. I have taken care to keep the language easy-to-learn, with a small grammar. Always looking for feedback on lexicon!

Issues

There are numerous issues with this conlang, which I'll list here for future reference:

- The lack of /m/ and /n/
- Use of tones
- Strict word-order
- The need to memorise consonant/vowel numeric values
- The need to mentally alter consonants depending on word order (needing active one-word lookahead)
- Lack of phonetic redundancy measures
- Extreme similarity between lexicon

Glossing

The English literal description of ki is called a "gloss". Apostrophes (') are prefixed to mark optional genres, double quotes (") are suffixed to Multi-/Omni-Roots, and commas (,) are suffixed to mark verbs.

Syntax & Morphology

ki is made of 'sentences'.

Syntax

Sentences are made of three 'genres': noun, verb, adjective. Each is a 'word'. Each sentence has a fixed pattern:

... (noun) noun (adj) verb (adj) noun ...

- Genres in parenthesis are optional, opposed to regular, marked by morphology.
- Until period is reached, the pattern will repeat at the ...
- Optional genres extend while marked
- adj apply to the preceding word
- Multi- and Omni-Roots extend over multiple words, and generally must fit each word into syntax; Special Lexicon interrupt normal syntax
- Adjacent numerics are treated as a list, by default as a set of separate options

Morphology

Words are made of 'bits', and correspond to a digital 8-bit byte. The first 4 bits is a consonant, the second 4 bits is a vowel.

- The first bit is 1 for optional, otherwise 0.
The proceeding 7 bits constitute the 'root'
- Omni-Roots possess more complex morphology than Multi-Roots
- It is optional, but recommended, for speakers to double the length of a verb's vowel, and for writers to append a comma (,) after a verb
- It is optional, but recommended, to put a space between all words except roots in the same Multi-/Omni-Root

Semantics

*Genre Semantics

Whereby: (nouns) Subject, Object, Pronoun;
(other) Verb, Adjective.

Pattern	Semantics & Transitivity
S...VOO...	S does V to O's ...which do V to O's...
(draft) SVPOVP.	S does V1 to P who does V2 with O to P
SVOOVP.	S does V1 to O's P does V2 to O's
SVOOVPOO	S does V1 to O1's P does V2 to O2's with O1's
PVObbyVPO	P1 does V1 to O1 by P2 doing V2 to O2
SVOPV.	S does V1 to O which P does V2 to
(draft) SVOPVPOO	

- pronoun ambiguity

- or SVOOV[by]SVOVO..., or OV[by]SVOOVVO..., or SVOPV (e.g. I like her me listen).

***Examples**

PVObyVPO – I show, work 'good 'by speak, him it

I show good work by him saying about it

Noun Semantics

Contiguous nouns are of their proceeding;

e.g. cat bird = cat of bird | bird's cat

This rule permeates all multi-nouns;

e.g. person school = person of school | teacher

- Default article is definite

Miscellaneous

***Possession**

thing my

***Imperative**

- Made by stating the possible scenario (e.g. You clean the bath!).

Special Lexicon

- Interrupt regular syntax

Numerics

Protocol 1

First root is "s_numeric0" ('KNP10'), proceeded by a byte: first bit ('overflow') signifies a proceeding numeric byte. All non-overflow bits constitute a N*7-bit binary value (N = amount of bytes).

Protocol 2.0 & 2.1

First root is "s_numeric1" (base-10, 'KNP20') or "s_numericA" (base-16, 'KNP21'), proceeded by 4-bits: the numeric's floored logarithm, proceeded by 4-bits: 0x8 for negative or 0x0 for positive; plus 0x4 for decimal. The proceeding log(n) digits are of consonants & vowels by their numeric value. If decimal, the next 4-bits' value expresses amount of precision digits.

- Pad with vowel <i> when necessary
- Expresses -16^{16} to 16^{16}

Periodic Elements

First root is "o_element", then expressed as the number of protons using KNP20.

Kinship

First root is "o_kinship", then move through relations from subject to kin.

Kinship	Link	C
male	link	b
male	final	p
female	link	d
female	final	t
unknown	link	g
unknown	final	k

Kinship	V
partner	i
sibling	y
parent	e
child	a
friend	o
neighbour	u
stranger	q

*Proper Nouns

Mono-Roots

- Adhere to normal syntax
- Root value is hexadecimal, regular
- Orthography is Latin word
- Includes frequent grammar roots
